How to install Minecraft Forge mod-development environment and Erik's mod, episode 4 and onwards

Follow the installation guide on

http://www.minecraftforge.net/wiki/Installation/Source

It has five main parts:

* Install java version 7. (go to oracle.com) If you already have java version 8 installed, it has to be uninstalled before.

* Update "path" environment variable

(Note: After this step, you need to restart the PC. Otherwise the update will not be applied)

* Download minecraftforge files (version 1.7.10)

* Run installation scripts

* Install eclipse

Once in eclipse, minecraft is started by just pressing the run-button.

To add Erik´s mod episode 4 (and later), download the source and unzip it. Copy the files to the src directory where minecraftforge was installed.

Remove the example mod that came with minecraftforge. It is easiest done by deleting the com.example.examplemod package from within eclipse. Or you delete it from the src directory. If you have installed Erik´s mod episode 3 source files, these are also removed by deleting the com.example.examplemod package.

Erik´s mod is in the package com.misccraft.mod, and the main file is called MiscCraft.java.
